Build a Quote Machine

In this project, you will use the skills and knowledge you've gained to create a Quote Machine. This project is due Monday morning at 8am.

Take your time, and make it look nice with CSS. Consider it a potential piece for your portfolio. This is a participation grade, but I highly encourage you to do the best you can.

Spend some time tinkering with the code and reading errors in your console. Every project involves running into errors and having to troubleshoot them.

As a developer, you will spend a good bit of your time researching issues and troubleshooting code. If you're not sure how to do something, look up examples to see how other developers created it. Read through their code and try to implement it on your website. Do not copy code, but use it as inspiration.

Requirements

- Create an array of at least 5 quotes with authors
- When the page loads, 1 of those quotes/author should be displayed on the page
- Every 30 seconds, display the next quote in the array (test this with a shorter time interval)
- Create a back button and a forward button for the quote machine. When a user clicks the back button, they should be taken to the quote before the current one in the array. When a user clicks the forward button, they should be taken to the next quote.
- Bonus: When switching between quotes, have them swipe in and out of the page.
- Bonus: Make the quote tweetable
