Build a Not-so-simple Website

1. Create an index.html page with the following:

   - Navigation - 4 links
   - H1 heading with id
   - 2 paragraphs

2. Add any placeholder content that you choose to those elements.

3. Use https://modernizr.com/ to add feature detection for geolocation.

4. If the browser supports geolocation, add a kitten image (https://placekitten.com/) to the page. If it doesn't, add a puppy image (http://www.placepuppy.net/) to the page.

5. If your page is the first visited in that tab (history.length), make the background lightblue. Otherwise, make the background light orange.

6. Style the h1 heading using getElementById.

Feel free to style more of your website with JavaScript.

Bonus: Style every even nav item differently from the odd nav items.
